

HDD/tunnelling

Tools for  
**true heroes!**

MADE IN GERMANY

**BETEK**

Progress!

## In use worldwide: BETEK tungsten carbide tools

1 - Road milling

2 - Surface mining

3 - Stabilising

4 - Recycling

5 - Foundation drilling

6 - Crushing and mixing

7 - Horizontal directional drilling HDD

8 - Mining

9 - Trenching

10 - Tunnelling

11 - Hydraulic milling cutters

12 - Forest mulching

13 - Agriculture

14 - Rail track construction

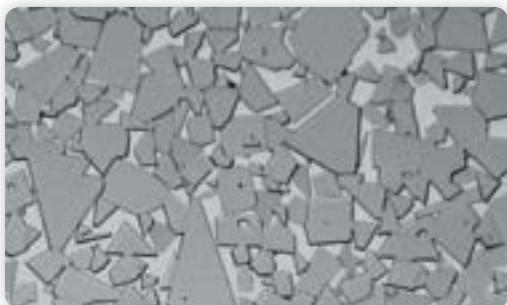

15 - TungStuds

16 - Abrasive wear protection

Use innovative tool systems from BETEK – and you'll make good progress with above-average daily productivity! The contours of BETEK tools and the grade of tungsten carbide used are always tailored to the job at hand. This ensures a long service life and minimal tool changes.

## Progress well with wear-resistant grades of tungsten carbide

Cross-section through grade B20G tungsten carbide,  
as used, for example, for tunnelling

## Tungsten carbide and steel – firmly bonded for extreme demands

Steel and carbide are two materials with totally different expansion coefficients when subjected to heat. Nevertheless, it is of steel and tungsten carbide that our tools are made, with tungsten carbide for the wear-resistant tip, and steel for the tool shank. Since tools reach high temperatures during use, extreme tensile stresses are generated. These stresses are absorbed by a special brazing material that joins the tungsten carbide tip to the steel section.

We have developed our own methods and systems for this brazing process, which is carried out on fully automated machines with the process covered in an inert protective gas. Manufacturing parameters are fully monitored and documented to ensure consistent quality. Afterwards, brazing shear strengths are checked to ensure that our "Masters of the construction site" lose no time due to broken tools!

Monitored manufacturing on the  
fully automated soldering machine

The soldering process to permanently  
bond tungsten carbide and steel

## How our high-tech tools are made

- Cost-effective client solutions based on flexible structures
- Tailored, fast response to client requirements

- Speedy creation of samples and prototypes
- Competitive prices thanks to close collaboration with all areas of production

- Raw materials of high purity used for great strength
- Consistently high, pore-free tungsten carbide quality produced through an exact process resulting from years of experience and know-how

Production equipment and processes specially developed to the utmost degree of perfection by experts in combining tungsten carbide and steel

Able to compete on the world market by virtue of a high degree of automation and flexible manufacturing plants

Permanent checking of quality in accordance with DIN ISO 9001:2000 and DIN EN ISO 14001 along the entire production chain all the way to the construction site

User training sessions at Betek or on the construction site itself to ensure long-term economic success and client satisfaction

Able to react quickly thanks to:

- The use of cutting edge IT and optimum logistics links
- Standard products kept in store

## HDD – Horizontal Directional Drilling

HDD (horizontal directional drilling) originates from the USA. It was introduced in the seventies as a deep drilling technique and has been developed constantly since that time.

Horizontal drilling is used primarily to cross below fixed surfaces (e.g. roads, railroads, airport runways etc.) and waterways in order to construct pipelines or cable lines without digging trenches.

The application areas for this technique are gaining greater importance every year. Examples of these include pipeline construction for crude oil, gas, refinery products, water, effluent and community heating networks, as well as extending underground electricity supply and data lines.

### **Horizontal drilling is done in three steps in general:**

1. Pilot bore hole using a pilot drill (in hard rock with a tricone bit)
2. Widening process appropriate to soil conditions using a hole opener or reamer
3. Process to pull in the pipeline using a reamer

### **Using tungsten carbide tools on a HDD machine:**

Tools tipped with tungsten carbide are not widely used in geological conditions where the rock is very soft. For that tools with hardened steel or hard facing are used.

If the rock is harder, tungsten carbide wear parts are used on the drilling tools. These may be tungsten carbide pins soldered or press-fitted onto the pilot drills, welded-on teeth and round shank bits on reamers and hole openers and/or rock-drilling heads for hard rock (tricone bits).

## Betek BTB09 tricone bits technical product information

### Technical data

**Borehole diameter:** 5 3/4" (146 mm)

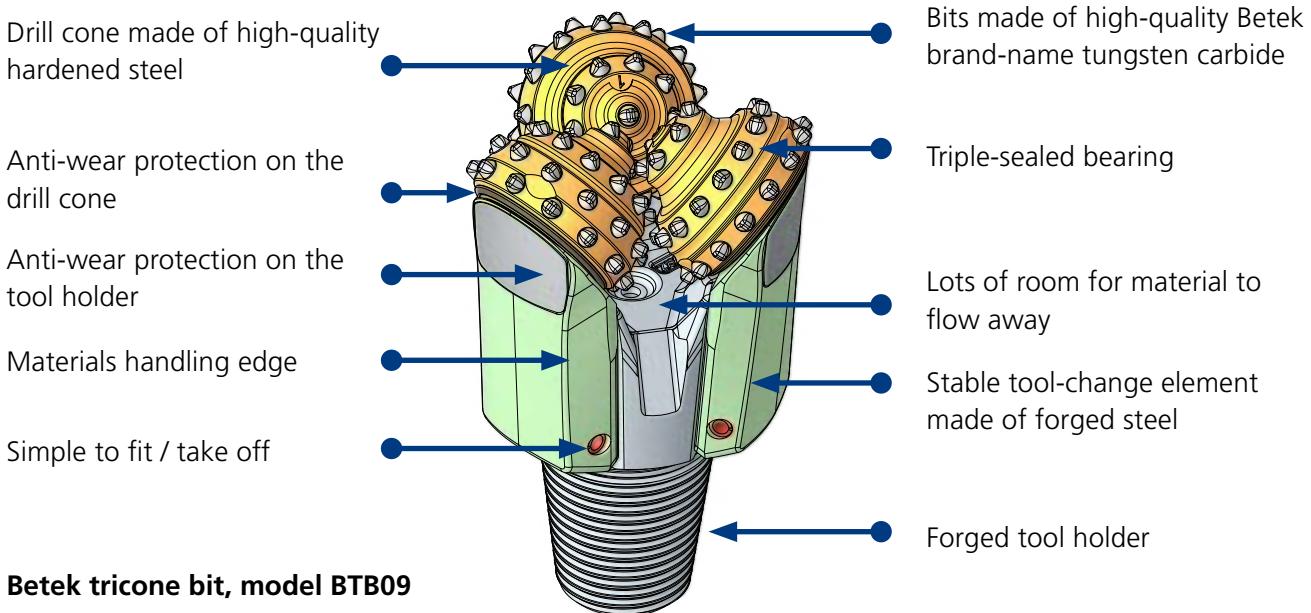

**Connection thread:** 2-7/8"-5 API regular taper

**Max. feed force:**

30,000 N

**Weight:**

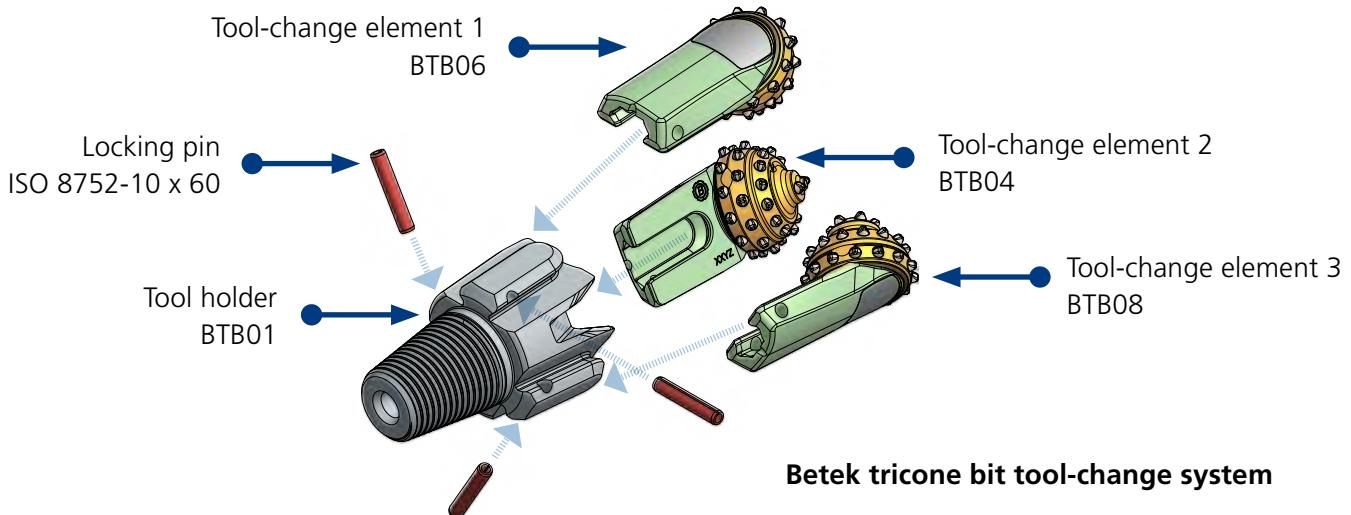

12.23 kg

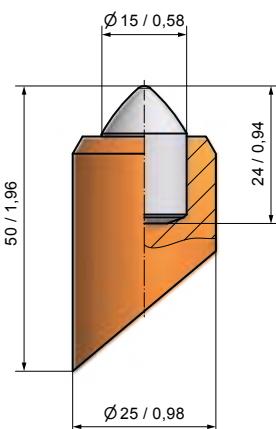

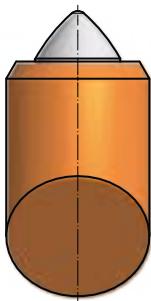

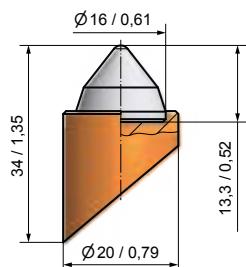

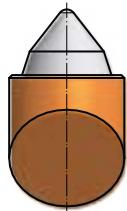

**Betek tricone bit, model BTB09**

### Benefits

- Complete tool-change system can be replaced (patent pending)
- Individual components (drill bits) can be replaced (patent pending)
- Runs with minimal vibration thanks to optimised shape of tool-changer arms
- Larger free cut means reduced wear on the steering head
- Less wear on the tool-changer arms thanks to geometrically optimum shape of the components (patent pending)
- Big cost benefit from reusable components
- Excellent value for money

## BETEK TungStuds with tungsten carbide core: Effective protection against wear for metal surfaces

BETEK TungStuds are on the front line when material is produced or processed. The TungStuds which are equipped with a tungsten carbide core are the first to come into contact with the material to be conveyed and are subjected to extreme abrasion. In addition to the wear protection through the TungStuds, the bound material to be conveyed is used as a material cushion. This means the direct abrasion of the metal surface due to the movement of materials is reduced.

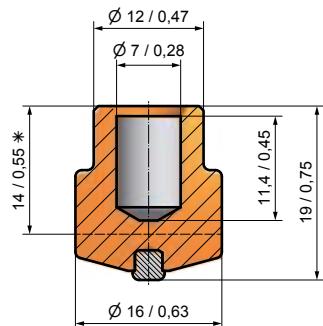

Instead of expensive spare parts which may be required due to worn-down metal surfaces, it is only necessary to replace the TungStuds. When using BETEK TungStuds also the maintenance outlay is reduced. Because of their tungsten carbide core they can resist to the most extreme conditions.
